EventFlow Constitution

Version 1.0 | Approved Baseline

Every Guest Matters. Every Event Flows.

Document Control

Document ID	EF-DOC-000
Title	EventFlow Constitution
Version	1.0
Status	Approved Baseline
Product	EventFlow
Document Owner	Product Owner
Technical Owner	Solution Architect
Created	2026-08-06
Last Updated	2026-08-06
Classification	Internal Product Governance
Related Documents	EF-DOC-001, EF-DOC-002, EF-DOC-003

Revision History

Version	Date	Status	Summary
0.1	2026-08-06	Draft	Initial constitutional principles.
0.2	2026-08-06	Draft for Review	Expanded governance, scalability, security, and release rules.
1.0	2026-08-06	Approved Baseline	Sprint 1 governance baseline approved for EventFlow development.

Approval Record

Role	Approval	Date
Product Owner	Approved Baseline	2026-08-06
Solution Architect	Reviewed and Baseline Prepared	2026-08-06

Preamble

EventFlow is a professional Event Operations Platform intended to manage the complete operational lifecycle of events, from event configuration and invitations through attendee management, communications, seating, reception, check-in, reporting, and future extensions.

This Constitution defines the highest-level product and engineering rules governing EventFlow. Lower-level requirements, architecture, database design, interfaces, implementation, testing, operations, and documentation must conform to it unless a formal amendment is approved and recorded.

Article I - Product Identity and Purpose

1. EventFlow shall be developed as a reusable Event Operations Platform, not as a single-event website, RSVP form, invitation plugin, or event-specific codebase.
2. EventFlow shall support multiple event categories through configuration and extension rather than event-specific source-code changes.
3. The Lui @ 60 implementation is the first production reference implementation and proving ground, but shall not constrain the long-term product architecture.
4. Product motto: **Every Guest Matters. Every Event Flows.**

Article II - Event-Centric Domain Model

1. The Event is the root business entity.
2. Invitations, attendees, communications, seating, check-ins, reports, audit records, and event-scoped settings belong to an Event.
3. Event ownership shall be explicit in the data model to support future multi-event operation without fundamental redesign.

Article III - Invitations and Attendees

1. An Invitation represents the organizer's invitation relationship with a primary guest or invitee group.
2. An Invitation may authorize one or more attendee places.
3. The primary guest and confirmed companions shall become Attendee records when individual identity is operationally relevant.
4. Invitation-level and attendee-level responsibilities shall remain distinct.

Article IV - Configuration Over Hard-Coding

1. Event-specific information shall be stored as data or configuration, not embedded in source code.
2. This includes event name, venue, schedules, branding, invitation artwork, wording, deadlines, communication templates, and integration settings.
3. A new event should normally require configuration and data import, not source-code modification.

Article V - Single Source of Truth

1. Every business fact shall have a defined authoritative owner.
2. Dashboards, caches, exports, and reports may reproduce data for performance or presentation, but shall not become conflicting sources of truth.
3. Data ownership shall be documented in the Database Design Specification.

Article VI - Modular Architecture

1. EventFlow shall be modular with clearly defined responsibilities, interfaces, and dependencies.
2. Shared capabilities shall be implemented as reusable services rather than duplicated logic.
3. Modules shall not silently take ownership of another module's business rules.

Article VII - Security, Privacy, and Least Privilege

1. Security and privacy are product requirements.
2. Administrative operations shall use authorization, capability checks, and anti-CSRF protections where applicable.
3. External input shall be validated and normalized; rendered output shall be appropriately escaped.
4. Credentials shall not be committed to source control or exposed to guests.
5. Invitation links shall use high-entropy, non-guessable tokens or an equivalent secure mechanism.
6. Sensitive operations shall be auditable.

Article VIII - Mobile-First and Accessible Experience

1. Guest-facing experiences shall be designed mobile-first.
2. Administrative interfaces shall remain responsive and operationally efficient.
3. Public interfaces shall follow WCAG-informed practices including keyboard usability, semantic structure, readable contrast, labels, and accessible forms.

Article IX - Scalability, Capacity, and Performance

1. Core entity relationships and module boundaries shall support growth from small events to events with several thousand attendees without fundamental redesign.
2. Measurable capacity targets shall be defined in the PRD and Architecture documents.

3. Bulk operations shall support batching, idempotency, retryability, and failure isolation where applicable.
4. Growing datasets shall use indexed, bounded, and paginated access patterns.
5. Expensive operations should move to asynchronous execution when scale justifies it.

Article X - Reliability and Operational Resilience

1. Event-day reliability takes precedence over novelty.
2. Critical workflows shall degrade gracefully when external integrations are unavailable.
3. External providers shall not become single points of failure for unrelated core operations.
4. Backups, migration safety, and rollback mechanisms are release requirements.

Article XI - Auditability and Observability

1. Material actions should be attributable to an actor, timestamp, event, action, and affected object.
2. Operational logs and audit logs serve different purposes.
3. Logging shall avoid unnecessary secrets or personal data.

Article XII - Documentation as a Product Deliverable

1. Documentation is part of EventFlow.
2. A release is incomplete until applicable controlled documentation is current.
3. Accepted ADRs shall not be silently rewritten; changes are recorded through new ADRs that supersede prior decisions.
4. Versioned documentation packages shall be archived at defined milestones.

Article XIII - Requirements and Decision Gates

Before material implementation, the team shall determine whether the work:

1. is covered by the PRD;
2. requires a new or superseding ADR;
3. changes the database, integration contracts, security posture, capacity assumptions, or UX standards;
4. requires controlled document updates;

5. has acceptance criteria and tests.

Article XIV - Versioning and Backward Compatibility

1. EventFlow shall use semantic versioning unless superseded by an ADR.
2. Breaking changes shall be intentional, documented, migration-aware, and appropriately versioned.
3. Existing event data shall be preserved through upgrades whenever practical.
4. Database changes shall use controlled migrations.

Article XV - Engineering Quality

1. Code shall favor clarity, maintainability, testability, and predictable behavior over cleverness.
2. Unnecessary dependencies shall be avoided.
3. Shared logic shall be reused rather than copied.
4. Technical debt may be accepted consciously but shall be documented when material.

Article XVI - Product Governance and Roles

1. The Product Owner owns business priorities, product direction, and acceptance.
2. The Solution Architect owns architectural integrity, technical trade-off analysis, and technical documentation.
3. Conflicts between short-term delivery and constitutional principles shall be surfaced explicitly.

Article XVII - Amendment and Exception Process

1. Constitutional amendments require documented rationale, impact analysis, Product Owner approval, Solution Architect review, and version increment.
2. Material architectural amendments require an ADR.
3. Temporary exceptions shall record scope, risk, owner, and planned resolution.

Article XVIII - Guiding Standard

Every Guest Matters. Every Event Flows.

Product decisions should improve the guest experience while helping organizers execute events predictably, securely, and efficiently.

Constitutional Interpretation

Where a lower-level document conflicts with this Constitution, the Constitution prevails until the conflict is resolved by approved amendment or correction.
